7. Deep learning
8. First outcomes
9. Conclusions & perspectives

## Great Crested Newt (*Triturus cristatus*)

## Current counting method

## ISSUES :

Time consuming and expansive

Injuries to amphibians and habitat

Low temporal resolution data

# AMPHIBIAN OBSERVATION PROCESS

## Automatisation

PoC  
NewTrap

- species richness (not only newts)
- temporal activity
- biometrics
- population size
- population dynamics
- ethology

Program capture

program MARK

# OUR SOLUTION

Patent LU93388 filled in 2016  
Design protection WIPO87166

# OUR SOLUTION

Battery (60A.h) + box on the bank

Recording of videos and Images (one picture by video)

# A CASE STUDY

## Capture-recapture study

1 pond followed in spring 2019:

Bascharage ~ 240m<sup>2</sup>

Depth max: 100 cm

Target:

## Comparison of 2 methods:

Units:

VS

Up to 20 “capture” sessions, from March to July

One session:

Random selection of squares for each session and method

## NEWTFLIX

Palmate newt (male)

Smooth newt (courtship)

Great crested newt predated palmate newt

Alpine newt (foraging female)

Grass snake

Great crested newt and Leech

## Encoding of conditions

## What is Deep Learning?

*“A set of automatic learning methods composed of algorithms and reproducing the functioning of a human neural network”*

Learning on  
specific criteria

### Image Informations

Species: Triturus cristatus  
Sex: Female  
Stage: Adult

Number: 1

Number precision: Exact

Reliability of species identification: Certain

Behaviour: Standing

## Requires:

- ⇒ Learning phase
- ⇒ Enough data to train on
- ⇒ A good GPU 

Background and lighting under control with NEWTRAP!!

**3 models** are running on NEWTRAP manager,  
using CNN transfer learning method

## 1<sup>st</sup> model:

- ⇒ **Determine the species**
- ⇒ learned on approximately 200 *T. cristatus*, 200 *L. helveticus*, 200 *L. vulgaris* and 200 other species
- ⇒ Classification accuracy: 90%

## 2<sup>nd</sup> model:

- ⇒ **Determine the sex** of any *T. cristatus* (adult)
- ⇒ learned on 1000 females and 2000 males
- ⇒ Classification accuracy: 99%
- ⇒ Discriminate regions by using Class Activation Map methodology

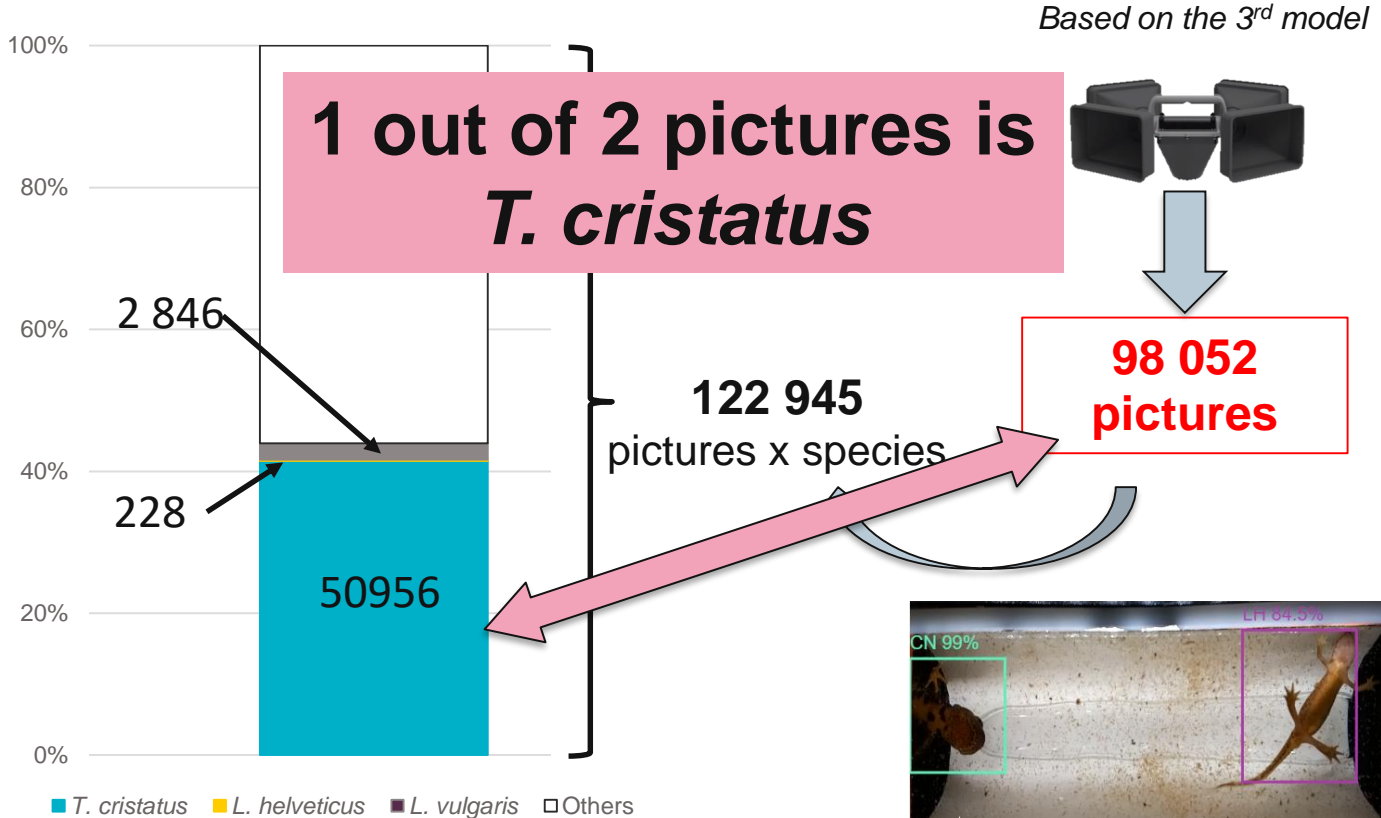

The tail is relevant to  
determine the sex

## 3<sup>rd</sup> model:

- ⇒ Determine simultaneously the species and the region in which the individual is located in the picture (bounding box)
- ⇒ Learned on approximatively 200 *T. cristatus*, 200 *L. helveticus*, 200 *L. vulgaris* and 200 other species + the bounding box coordinates
- ⇒ Classification accuracy: 97%

## Raw results from modelling (without individualisation)

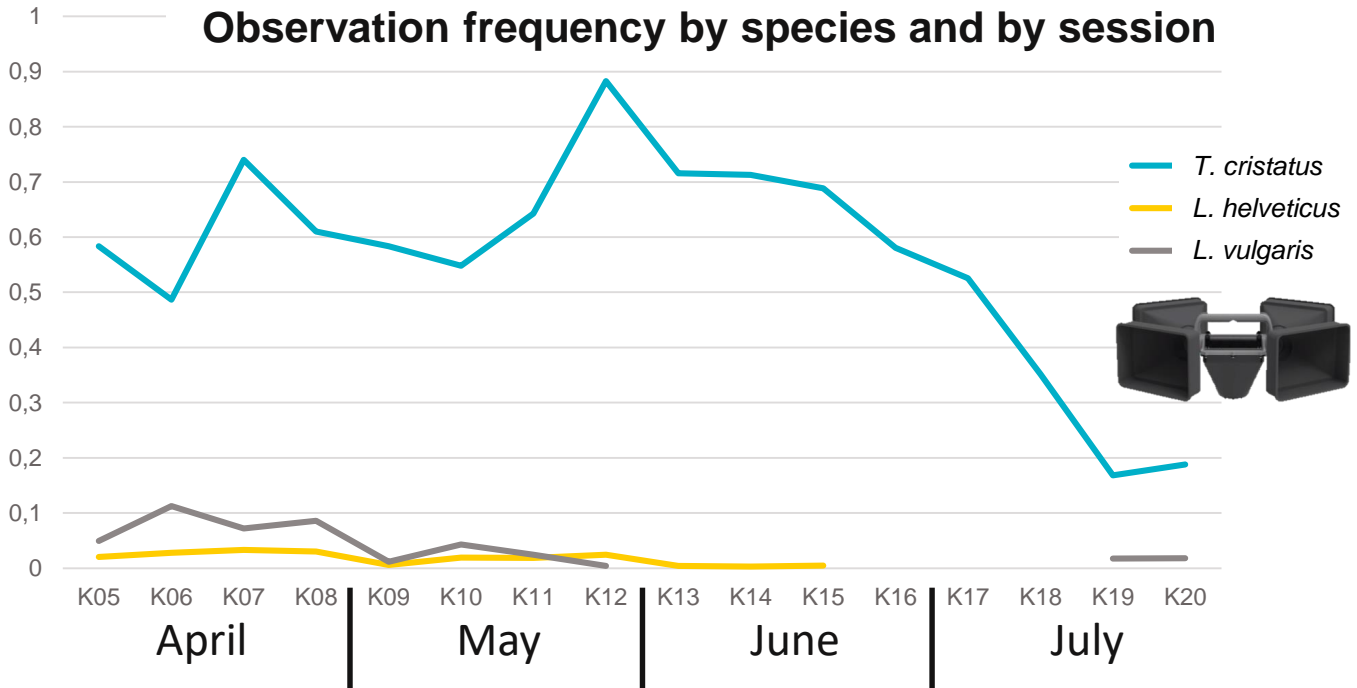

# FIRST OUTCOMES

**Results from modelling** (without individualisation)

Up to 24 per day

*Based on the 3<sup>rd</sup> model*

$$= \frac{\sum \text{nb of hours with detection per session}}{\sum \text{nb of operating hours per session}}$$

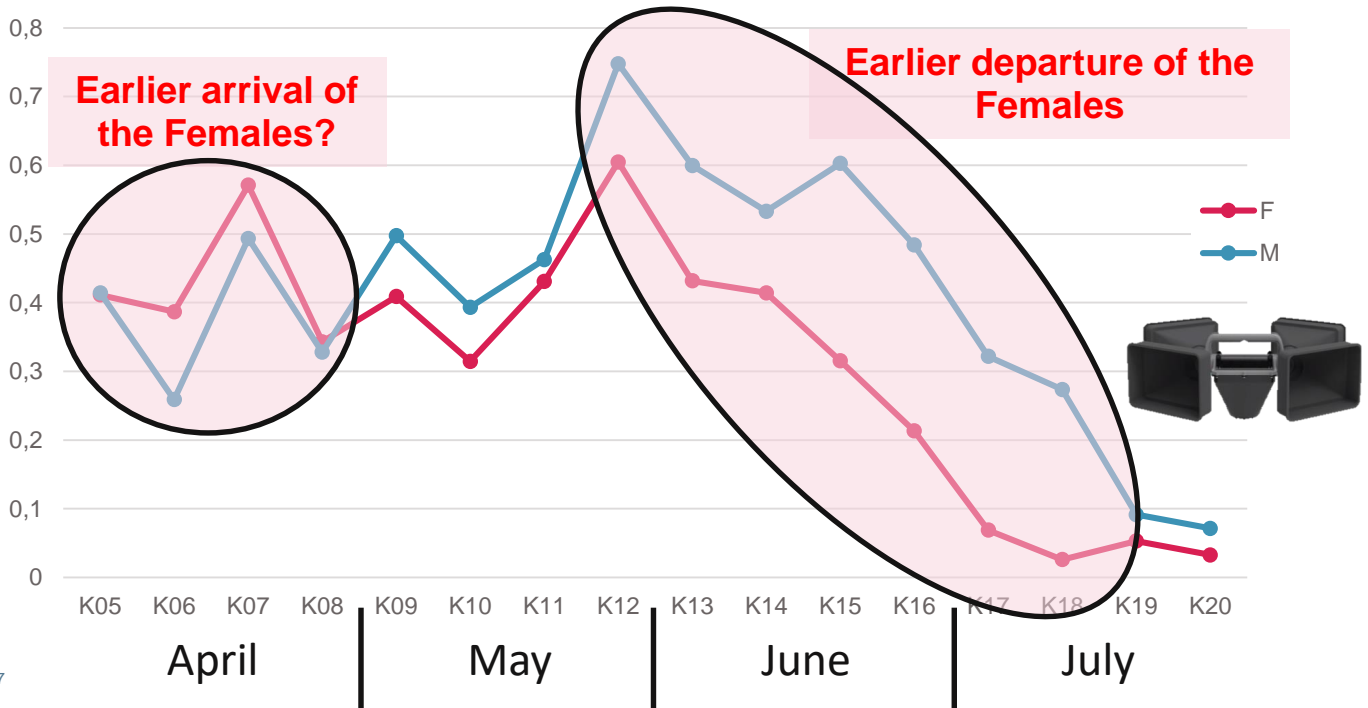

## Results from modelling (without individualisation)

Based on the 3<sup>rd</sup> model

### *T. cristatus*

### Observation frequency by sex and by session

## Results from modelling (without individualisation)

Based on the 3<sup>rd</sup> model

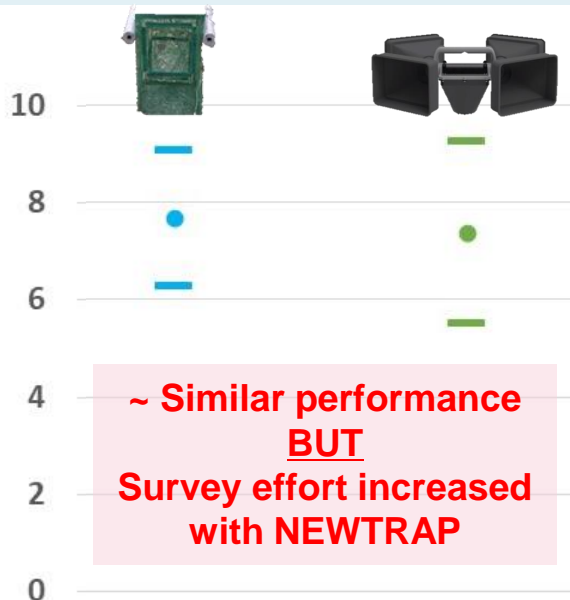

### Number of hours with detection per time of day

## Results from individualisation on *T. cristatus*

Mean number of unique individuals caught per trap and per day

**Partial analysis done on 10 sessions**  
from mid April to end of June

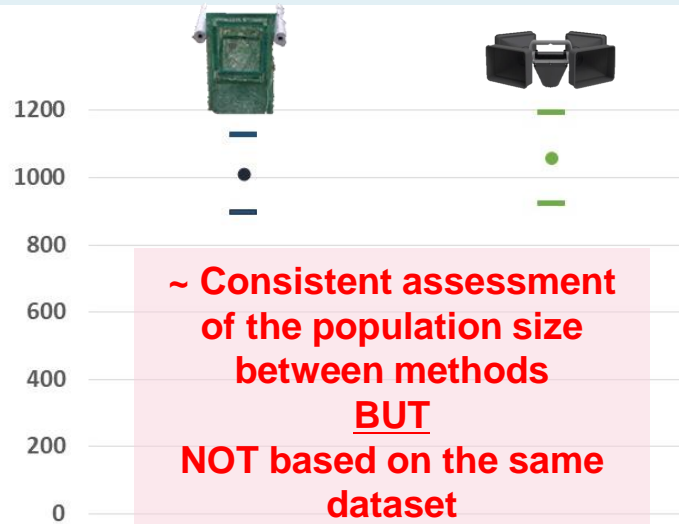

Assessment of the population size

**Partial analysis done on 15 sessions**  
from March to end of June

**Partial analysis done on 10 sessions**  
from mid April to end of June

## Technical and financial aspects

Cost:

~ **750€** / prototype (without considering labour costs)

Robustness:

**Limited** (distortion with heat during the season)

Operating time:

**2,86 days** (with a 60 A.h battery and based on 10 sessions)

Size:

**60 x 40 x 30 cm** with funnels (L x l x h)

## NEWTRAP - Apparatus:

=> NEWTRAP produces **high temporal resolution data**

**Detection  
of presence**

**Population  
estimates**

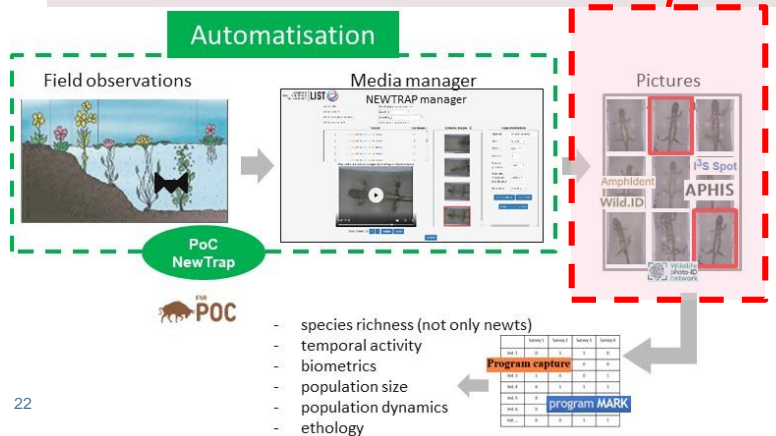

=> **New tool**  **A protocol has to be defined**

=> Technical issues are identified

=> Looking for a company to go further

## NEWTRAP Manager and the predict tools:

- ⇒ Very **helpful to manage and pre-treat** datasets
- ⇒ Development of an **appropriate and working** pattern comparison software
- ⇒ Improve and extend algorithm to other species

- ⇒ **Other ponds to enhance the library**
- ⇒ **Tests in other conditions**
- ⇒ **Other species, Larva**

## NEWTRAP opens new doors for amphibian field ecology
